Earning ₹2 Lakh Won't *Larger Corpus*

Gross Salary *Versus Real* Savings

❓ COMMON QUESTION

A higher monthly pay bracket automatically guarantees a massive 10-year wealth pool.

✅ SOURCE-BACKED ANSWER

Only your actual investible surplus—the money left and invested after expenses—grows your wealth.

Three Drivers Of Future Growth

- Monthly Investment: The exact surplus you invest consistently every month.
- Portfolio Returns: The actual rate of growth your investments earn over 10 years.
- Inflation Impact: The rise in prices that reduces what your money can buy in the future.
- High Gross Salary Alone: Uninvested income does not compound into wealth.

The Power Of Monthly Surplus

VERIFIED MARKET METRIC

₹50,000

Baseline Monthly Salary

Whether earning ₹50,000, ₹1 lakh, or ₹2 lakh a month, steady monthly investing over 10 years builds wealth if living costs leave room to save.

Compounding Through *Consistent Returns*

Inflation Erodes *Future Purchasing* Power

A 'corpus' is your total accumulated pool of money. However, goods will cost significantly more in 10 years due to inflation (rising daily living costs). Your investment returns must outpace price increases, or your savings will buy fewer goods in the future than they do today.

Protecting Wealth *Against Real* Costs

- Base future wealth targets on actual investible surplus, not your total CTC.
- Acknowledge that market returns fluctuate across a 10-year horizon.
- Discount future target numbers to reflect real purchasing power.

Focus on *Surplus, Not* Just Income
