#MARKETDEBUNK

The

23,750 Support

Trap

Buying The *Broadcasted Support* Floor

Retail traders view the broadcasted **23,750** support zone as a guaranteed floor for mean reversion. In reality, institutions use predictable technical support levels during global sell-offs as exit liquidity to match retail buy-limit orders against overnight short hedges.

How Liquidity *Is Quietly* Extracted

When GIFT Nifty trades lower, retail limit orders stacked around the **23,750** level absorb institutional sell flow. Smart money dumps risk onto eager retail dip-buyers before price breaks down further, turning technical support into a high-density trap.

Order Flow

And Exit

Liquidity

Market makers exploit predictable technical zones. By filling passive retail buy orders at the **23,750** support, institutional desks transfer overnight gap risk. Retail traders end up holding underwater positions while institutional portfolios remain Delta-neutral or net short.

Measuring The *Hidden Rupee* Erosion

Catching falling knives at static support burns capital fast. Entering at **23,750** without volume validation leads to average drawdown spirals of **1.8% to 3.2%** per gap-down session, compounding severe long-term portfolio drag over multiple trade cycles.

The 30-Minute *Execution Rule*

Never place limit buy orders at technical support zones like **23,750** during global sell-offs. Wait for at least **30 minutes** of post-open spot volume confirmation to ensure institutional buyers have absorbed supply before committing fresh capital.

The Pre-Trade

Audit Protocol

Before buying any support level near **23,750**, verify three factors: confirm GIFT Nifty arbitrage spreads, audit spot market opening volume over **30 minutes**, and check institutional FII cash segment net flow to avoid liquidity traps.
