Sensex down **1,000 points** and Nifty

@Market_Debunk

SWIPE

What is *an Index?*

card_text Think of the Sensex and Nifty as a 'report card' for the biggest companies in India. When they drop, it means the market as a whole is feeling pressure, not necessarily that your specific investments have failed.

Why did *the market* drop?

card_text Large drops are often caused by 'broad-based selling.' This happens when many investors react to global news or economic sentiment at the same time, causing a temporary dip in prices across the board.

Myth vs. **Reality**

comparison_data Myth: A 1,000 point drop means my investment is worthless. Reality: A drop in the index is a change in the current price, not a loss of your long-term value.

The SIP Advantage

card_text If you invest through an SIP (Systematic Investment Plan), a market drop is actually a chance to buy more units for the same amount of money. You are buying 'on sale' when prices are lower.

Should you *sell now?*

checklist_data Panic selling: FAIL. Reviewing your original goal: PASS. Checking if your risk tolerance has changed: PASS. Staying invested for the long term: PASS.

Your Action Plan

flowchart_data 1. Take a breath. 2. Check your investment horizon (are you investing for 5+ years?). 3. Ignore the daily noise. 4. Stick to your original plan.

Stay calm, *stay invested*
